

Reflection

I created an e-commerce website that displays various premium cookies. These are showcased in a clean, organized, and visually pleasing layout, which successfully accomplished my goal of creating an appealing and easy to navigate site. I chose this topic because I wanted my project to reflect something I genuinely love, making my experience of creating it more enjoyable.

As someone whose weakness is anything related to technology and coding, the most difficult part of building my website was having to deal with continuous errors in the code. Despite my low confidence in this aspect, I managed to overcome these obstacles by experimenting. I just kept typing, testing, adjusting, and trying different approaches until the errors were resolved. This long, irritable process helped me to stay persistent, which motivated me to accomplish the task efficiently.

One thing I am proud of about my output is that I was able to complete it successfully despite not following the original timeline. I experienced excessive fatigue from the recent school days, which resulted in me starting later than planned. Nevertheless, I pushed through and managed to finish the project within the allocated timeframe, making me feel so fulfilled. Although if I had more time to accomplish the task, I would improve both my organization and time management skills, as these were the main factors that slowed me down. I spent a significant amount of time planning and conceptualizing my output, which caused a lot of postponement that heavily affected my overall schedule. Additionally, I would choose a topic that feels more meaningful to me, such as advocating for peace and justice.

Overall, this project helped me gain some technical knowledge and I surprisingly enjoyed creating it, which helped me fill the gap in what I had always considered my weakness. Aside from that, this project served as another important lesson because it taught me what I should improve, what I should continue doing, and what I should avoid doing in future tasks. It reminded me that proper preparation, organization, and time management are essential in order to observe better outcomes. It also helped me remain patient, determined, and flexible, which are important characteristics I can apply in real-world situations.
